MITIS SALIVARIUS AGAR (7277)

Intended Use

Mitis Salivarius Agar is used for the isolation of Streptococcus mitis, Streptococcus salivarius, and enterococci.

Product Summary and Explanation

Streptococcus mitis, Streptococcus salivarius, and Enterococcus spp. are part of normal human flora. S. mitis and S. salivarius are known as viridans streptococci. These organisms play a role in cariogenesis and infective endocarditis, and cause an increasing number of bacteremias. Enterococci cause urinary tract infections, wound infections, bacteremia, and can colonize the skin and mucous membranes.

Principles of the Procedure

Enzymatic Digest of Casein and Enzymatic Digest of Animal Tissue provide carbon, nitrogen, and amino acids used for general growth requirements in Mitis Salivarius Agar. Sucrose and Dextrose are carbohydrate sources. Dipotassium Phosphate is the buffering agent. Trypan Blue is absorbed by the colonies, producing a blue color. Crystal Violet and Potassium Tellurite inhibit most Gram-negative bacilli and Gram-positive bacteria except streptococci. Agar is the solidifying agent.

Final pH: 7.0 ± 0.2 at 25°C

Formula may be adjusted and/or supplemented as required to meet performance specifications.

Precautions

1. For Laboratory Use.
2. IRRITANT. Inhalation of powder may cause respiratory irritation.

Directions

1. Suspend 90 g of the medium in one liter of purified water.
2. Heat with frequent agitation and boil for one minute to completely dissolve the medium.
3. Autoclave at 121°C for 15 minutes.
4. Cool the sterile medium to 50 - 60°C and aseptically add 1 mL of a 1% filter sterilized potassium tellurite solution.

Quality Control Specifications

Dehydrated Appearance: Powder is homogeneous, free flowing, and light blue-beige.

Prepared Appearance: Prepared medium is clear to slightly hazy and deep royal blue.

Expected Cultural Response: Cultural response on Mitis Salivarius Agar, enriched with 1% potassium tellurite solution at 35°C after 18 - 48 hours incubation.

The organisms listed are the minimum that should be used for quality control testing.
**Test Procedure**
Refer to appropriate references for specific procedures.

**Results**
*S. mitis* produces small blue colonies. These colonies may become easier to distinguish with longer incubation. *S. salivarius* produces blue, smooth or rough "gum drop" colonies, 1 - 5 mm in diameter depending on the number of colonies on the plate. *Enterococcus* spp. form dark blue or black, shiny, slightly raised, 1 - 2 mm colonies.

**Storage**
Store sealed bottle containing the dehydrated medium at 2 - 30°C. Once opened and recapped, place container in a low humidity environment at the same storage temperature. Protect from moisture and light by keeping container tightly closed.

**Expiration**
Refer to expiration date stamped on the container. The dehydrated medium should be discarded if not free flowing, or if appearance has changed from the original color. Expiry applies to medium in its intact container when stored as directed.

**Limitations of the Procedure**
1. Due to varying nutritional requirements, some strains may be encountered that grow poorly or fail to grow on this medium.
2. If coliforms grow on the medium, they produce brown colonies.
3. Molds will grow on the medium after two days incubation.
5. Beta-hemolytic streptococci produce colonies that resemble *S. mitis*.
